

TSH Testing

Thyroid disease is being identified more frequently as the primary cause of many chronic disease states, such as obesity, depression, fatigue, and numerous other hard to identify disorders. If the patient's problem is thyroid disease, it's usually easy and inexpensive to treat, eliminating the need for more invasive and costly testing.

BioSafe's TSH Test is the only product of its kind on the market, producing a quantitative analysis of blood TSH. The amount of TSH present is directly related to both hyperthyroidism and hypothyroidism.

BioSafe's blood collection kit can be used in two ways. For the Physician, it provides an easy and convenient way for you to get CLIA certified lab results in your office. For Hospitals, Pharmacies, and Public Screening Companies, it provides a way to test individuals in a screening setting and then have the results mailed directly to the participant.

Although the collection process still requires just a fingerstick, the sample is collected using BioSafe's new **Blood Transportation System (BTS)**.

The BTS is shipped to BioSafe  for analysis and the results are faxed back to the physician or a very easy-to-read lab report is mailed to the screening participant.

This patent pending technology will allow BioSafe to bring new cost-saving tests more quickly to the marketplace.

Early Detection is the key... Test Now.
